

AI Mobile Engineer

You don't need to master all of JavaScript to build mobile apps — but if these few concepts are unclear, React Native code will always feel confusing.

Variables

- Variables store data.
- `let` → value can change.
- `const` → value should not be reassigned.

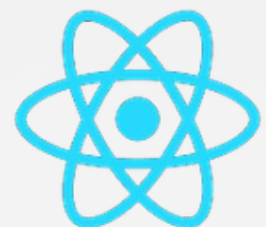

Functions

- Functions are reusable blocks of code.
- They help us organize application logic.

Arrow Functions

- Arrow functions are a shorter way to write functions.

Objects & Arrays

- Object → stores related data using key-value pairs.
- Array → stores multiple values in one place.
- Both are used constantly in React Native apps.
- Mobile connection: API responses, user profiles, products, messages — mostly objects and arrays.

Array Destructuring

- Destructuring lets us take values out of an array easily.

Object Destructuring

- Same idea, but with objects.

Template Literals

- Template literals let us easily combine text with variables.
- Use backticks ` and \${}.
- Mobile use: dynamic messages, URLs, API endpoints, UI text.

Promises

- A Promise represents a value that we will receive later.
- For example:
- API request, Database request, AI response & File upload
- A Promise can be:
- Pending
- Fulfilled
- Rejected

Async / Await

- async makes a function return a Promise.
- await pauses execution until the Promise finishes.
- Together they make asynchronous code read like clean, step-by-step code.

Modules

- Modules allow us to split our code into multiple files.
