

AI Mobile Engineer

Before we build a single AI-powered mobile app, we need to build the right development environment.

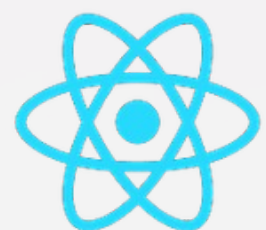

Node.js

- JavaScript runtime for running JavaScript outside the browser.
- Required by React Native and Expo development tools.
- Includes npm for installing packages and tools.
- We will verify Node.js and npm from the terminal.

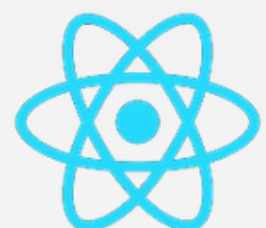

Visual Studio Code (VS Code)

- Our main code editor.
- Used to write, organize, debug, and manage the project.
- Supports extensions for React Native, TypeScript, Git, and AI tools.
- Lightweight and highly customizable.

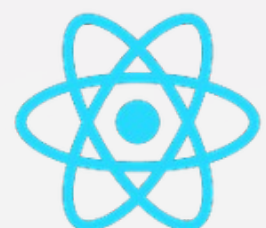

Expo

- A framework and platform built around React Native.
- Simplifies mobile development and device testing.
- Provides tools for building and deploying apps.
- We will install the modern Expo tooling and create our first project.

Cursor

- AI-powered code editor based on VS Code.
- Helps understand, generate, modify, and debug code.
- Can understand project context.
- We will use AI without blindly accepting generated code.

Claude

- AI assistant for coding, reasoning, debugging, and architecture.
- Useful for reviewing code and solving complex problems.
- We will use it as an engineering assistant, not a copy-paste machine.
