

AI Mobile Engineer

A mobile app can be functional, but animations are what make it feel premium.

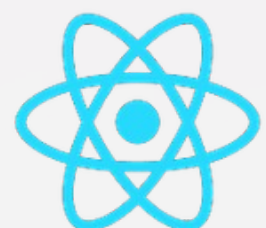

What is Animation?

- Animation = smooth visual change over time
- Makes UI feel responsive and polished
- Used for transitions, buttons, lists, modals, loaders

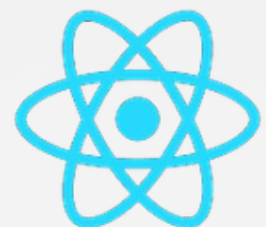

Reanimated

- Advanced animation library for React Native
- Smooth, high-performance animations
- Works well with gestures
- Best for complex/custom animations.

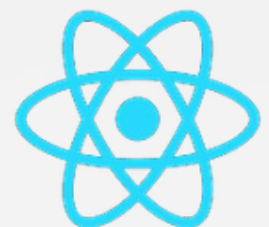

Gesture Handler

- Detects touch gestures
- Swipe, drag, pan, pinch, long press
- Works closely with Reanimated
- Used for interactive UI

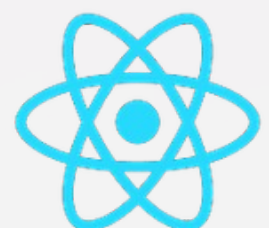

Moti

- Simplifies Reanimated
- Easier API for common animations
- Great for fade, scale, slide, enter/exit animations
- Good when you want less animation code

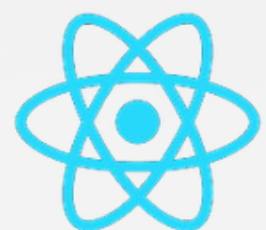

Bottom Sheet

- Panel that slides from bottom
- Used for filters, menus, actions, details
- Can be opened, closed and dragged
- Common in modern mobile apps

Shared Element Transitions

- Same UI element visually moves between screens
- Creates a connected screen-to-screen experience
- Common for images, cards and product details

Simple Rule

- Animation → Reanimated/Moti
- Gesture → Gesture Handler
- Bottom Panel → Bottom Sheet
- Screen-to-Screen Visual Transition → Shared Element
