TechZeen

AI Mobile Engineer

Imagine an AI mobile app that doesn't just answer your questions but actually takes action.

What is Agentic AI?

- Agentic AI: AI that can make decisions and take actions to achieve a goal.
- Traditional AI: Mainly responds to user prompts.
- Agentic AI: Plans, uses tools, takes multiple steps, and works toward completing tasks.
- Goal-oriented: Focuses on completing a task, not just generating an answer.

AI Agents on Mobile

- AI Agent: An AI system that can understand a goal and decide what to do next.
- Planning: Breaks a complex task into smaller steps.
- Tools: Uses app functions or external services to perform actions.
- Memory: Maintains relevant context from previous interactions.
- Multi-step Flows: Completes tasks through multiple connected actions.
- Mobile Example: An AI study assistant that creates a study plan, schedules reminders, and tracks progress.

Function / Tool Calling

- Function Calling: Allows an AI model to request the execution of predefined app functions.
- Tool Calling: Allows the model to select available tools based on the user's request.
- Structured Actions: The model returns structured arguments, usually in JSON format.
- App Execution: Your application validates the request and executes the selected function.
- Result Handling: The app sends the tool result back to the model so it can continue.
- Important: The AI requests an action; your application controls and executes it.

How an Agentic Mobile App Works

- User gives the AI a goal.
- AI understands the request and plans the steps.
- AI selects an appropriate tool or function.
- Mobile app validates and executes the action.
- The result is returned to the AI.
- AI decides whether another step is needed.
- The app presents the final result to the user.

Production Best Practices

- Define clear permissions for every tool.
- Validate all tool arguments before execution.
- Ask for user confirmation before sensitive actions.
- Limit unnecessary tool calls and execution loops.
- Store memory securely and only when needed.
- Never expose secret API keys inside the mobile app.
