

AI Mobile Engineer

If you understand these React concepts today, you'll stop copying React Native code from AI and start building your own mobile apps.

Components

- Reusable building blocks of a React Native app.
- A component describes what should appear on the screen.
- Examples: Button, Header, LoginScreen.
- A function is simply a reusable piece of JavaScript logic; a React component is a function that returns UI.

Props

- Props are data passed from a parent component to a child component.
- Props make components reusable.
- Props are read-only.

State

- State is data that belongs to a component.
- When state changes, React updates the UI.
- Example: counter value, login status, dark mode.

Hooks

- Hooks let functional components use React features.
- Common hooks:
- `useState` → manage state
- `useEffect` → perform side effects
- `useContext` → access shared data
- `useMemo` → optimize calculations
- `useRef` → keep a value/reference

Lifecycle

- A component goes through different stages:
- Mount → Update → Unmount
- Mount: component appears.
- Update: its state/props change.
- Unmount: component is removed.
- `useEffect()` is commonly used to handle lifecycle-related side effects.

API

- API = Application Programming Interface.
- It allows our mobile app to communicate with a backend/server.
- Example: App requests user data → API sends the data → app displays it.
