

AI Mobile Engineer

Imagine building a mobile app where your folders automatically become your screens, your files automatically become your routes, and navigation almost feels like magic.

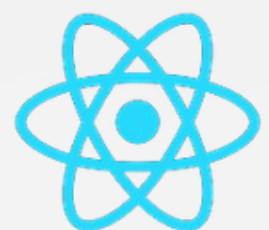

Problem with Traditional Navigation

- Navigation can become complicated as an app grows.
- Routes are often configured manually.
- Managing screens, nested navigation, and navigation structure can become difficult.

What is Routing?

- Routing means deciding which screen should appear for a particular route.
- Example:
- / → Home
- /profile → Profile
- /settings → Settings

What is File-Based Routing?

- Your file and folder structure defines your routes.
- No need to manually register every screen.
- Easy to understand and maintain.

Example:

app/

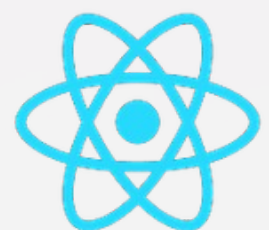

└── index.tsx

└── profile.tsx

Automatically becomes:

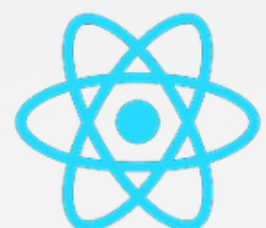

/ → Home

/profile → Profile

What is Expo Router?

- Expo Router is a file-based routing system for React Native and Expo apps.
- Built on top of React Navigation.
- Supports:
- Stack navigation, Tabs, Nested routes, Dynamic routes, Deep linking & Layouts

Why Expo Router?

- Cleaner project structure
- Less navigation boilerplate
- Scales well for large applications
- Easy nested navigation
- Modern Expo-recommended approach
