What if I told you that you can style your React Native apps almost like websites — faster, cleaner, and with far less styling code?

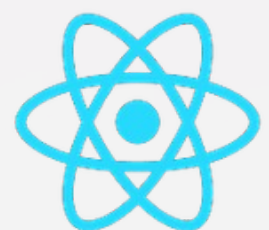

Problem with StyleSheet

- Styles are usually written separately from JSX.
- Large apps can end up with huge style objects.
- Reusing and maintaining styles can become repetitive.
- Making consistent UI quickly can take more code.

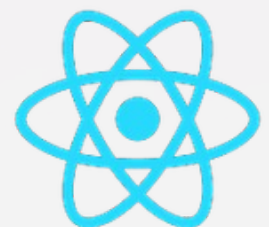

What is Tailwind CSS?

- A utility-first CSS framework.
- Instead of writing custom CSS, we use small utility classes.
- Example:
 - p-4 → padding
 - text-lg → larger text
 - font-bold → bold text
 - bg-blue-500 → background color

Why Tailwind?

- Faster UI development
- Less custom styling code
- Consistent design
- Easy responsive styling
- Easy to modify and maintain

Can We Use Tailwind with React Native?

- Yes., React Native itself doesn't use traditional CSS like the web.
- But NativeWind brings a Tailwind-style utility-class experience to React Native.
