

AI Mobile Engineer

A beautiful mobile app can still feel terrible if its lists lag, its loading screens look broken, or users see a blank screen when there's no data.

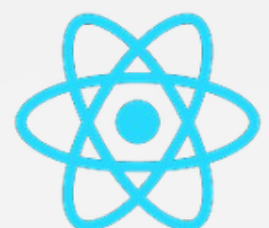

FlatList

- React Native's built-in component for rendering large lists efficiently.
- Renders items efficiently instead of loading everything at once.
- Perfect for products, messages, posts, users, etc.

FlashList

- A high-performance list component from Shopify.
- Designed for smooth scrolling and large datasets.
- A strong choice when list performance becomes important.

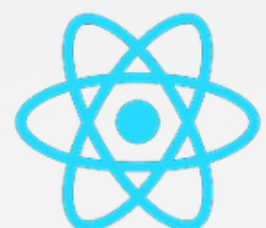

Cards

- A reusable UI container for displaying related information.
- Common for products, posts, profiles, courses, transactions, etc.
- Should be reusable and consistent across the app.

Skeleton Loaders

- Placeholder UI shown while content is loading.
- Gives users immediate visual feedback.
- Creates a smoother experience than showing a blank screen or spinner alone.

Empty States

- UI shown when there is no data.
- Example: "No tasks yet — Create your first task."
- Should explain the situation and ideally provide an action.

Error States

- UI shown when something goes wrong.
- Example: API failure or network problem.
- Should clearly explain the problem and provide a Retry option where appropriate.
