AI Mobile Engineer

What if you could build a complete backend for your mobile app without spending weeks building servers, authentication, databases, and file storage from scratch? That’s the idea behind BaaS.

TechZeen

What is BaaS?

- BaaS = Backend as a Service
- Provides ready-made backend features
- Database, authentication, storage, APIs and more
- Lets developers focus more on the app

TechZeen

What is a Database?

- Stores and organizes application data
- Examples: users, products, orders, messages
- Data can be created, read, updated and deleted

SQL vs NoSQL

- SQL → structured data in tables
- NoSQL → flexible data, often documents/collections
- SQL is useful for relationships between data
- NoSQL is useful when data structure is more flexible

PostgreSQL

- Powerful SQL relational database
- Uses tables, rows and columns
- Supports relationships between tables
- Used by Supabase

Firebase

- Google's BaaS platform
- Uses Firestore and Realtime Database
- Authentication, storage, notifications and more
- Strong real-time and mobile-focused ecosystem

Supabase

- Open-source Firebase alternative
- Built around PostgreSQL
- Database, Auth, Storage, Realtime and APIs
- SQL and relational data are first-class concepts
